# TABLE OF CONTENTS

1. ATAM Presentation
2. Business Drivers
3. Architecture
4. Architectural approaches
5. Quality attribute utility tree

# ATAM ASSESSMENT STEPS

1

- Present the ATAM

2

- Present **FDIR** business drivers

3

- Present **FDIR** architecture made through **ACME**

4

- Identify **FDIR** architectural approaches made through **ACME**

5

- Generate **FDIR** quality attribute utility tree

6

- Analyze architectural **FDIR** approaches made through **ACME**

7

- Brainstorm and prioritize scenarios of **FDIR requirement**

8

- Analyze **FDIR** architectural approaches made through **ACME**

9

- Present **FDIR** ATAM assessment results

# 1. ATAM PRESENTATION

## ❑ *Architecture Tradeoff Analysis Method*

- ❑ Risk identification method to assess the consequences of architectural decisions in light of quality attribute requirements.
- ❑ The ATAM can be done early in the software development life cycle.
- ❑ It can be done relatively inexpensively and quickly (because it is assessing architectural design artifacts).
- ❑ The ATAM will produce analyses commensurate with the level of detail of the architectural specification.

# 1. ATAM PRESENTATION

- ❑ Three of the major goals of ATAM are to:
  - ❑ elicit and refine a precise statement of the architecture's driving quality attribute requirements
  - ❑ elicit and refine a precise statement of the architectural design decisions
  - ❑ evaluate the architectural design decisions to determine if they satisfactorily address the quality requirements

# 1. ATAM PRESENTATION

- ❑ The output of an ATAM is an out-brief presentation and/or a written report that includes the major findings of the evaluation.
- ❑ These are typically
  - ❑ the architectural styles identified
  - ❑ a "utility tree" - a hierarchic model of the driving architectural requirements
  - ❑ the tradeoff points
  - ❑ the sensitivity points
  - ❑ a set of identified risks
  - ❑ a set of identified non-risks

## 2. BUSINESS DRIVERS - CONTEXT

- ❑ Client : NASA
- ❑ Users : Spaceship crew and flight control can manually control the system
- ❑ The problem : Fault detection
  - ❑ Detected when monitored values are out-of-tolerance
- ❑ The solution : Fault protection system (FDIR)
  - ❑ Act when the spacecraft is going through an error or a fault
  - ❑ FDIR is a layered system. If a lower layer cannot resolve an issue it's forwarded to an upper layer. If the Issue cannot be resolved by the system. It's escalated to manual control.
  - ❑ Automatic system

## 2. BUSINESS DRIVERS - REQUIREMENTS

### ❑ Clients global needs :

- ❑ Guarantee the completion of any time critical activities of the spaceship
- ❑ Keep the control of the spacecraft with safety, observability & commandability

### ❑ Main qualities attributes :

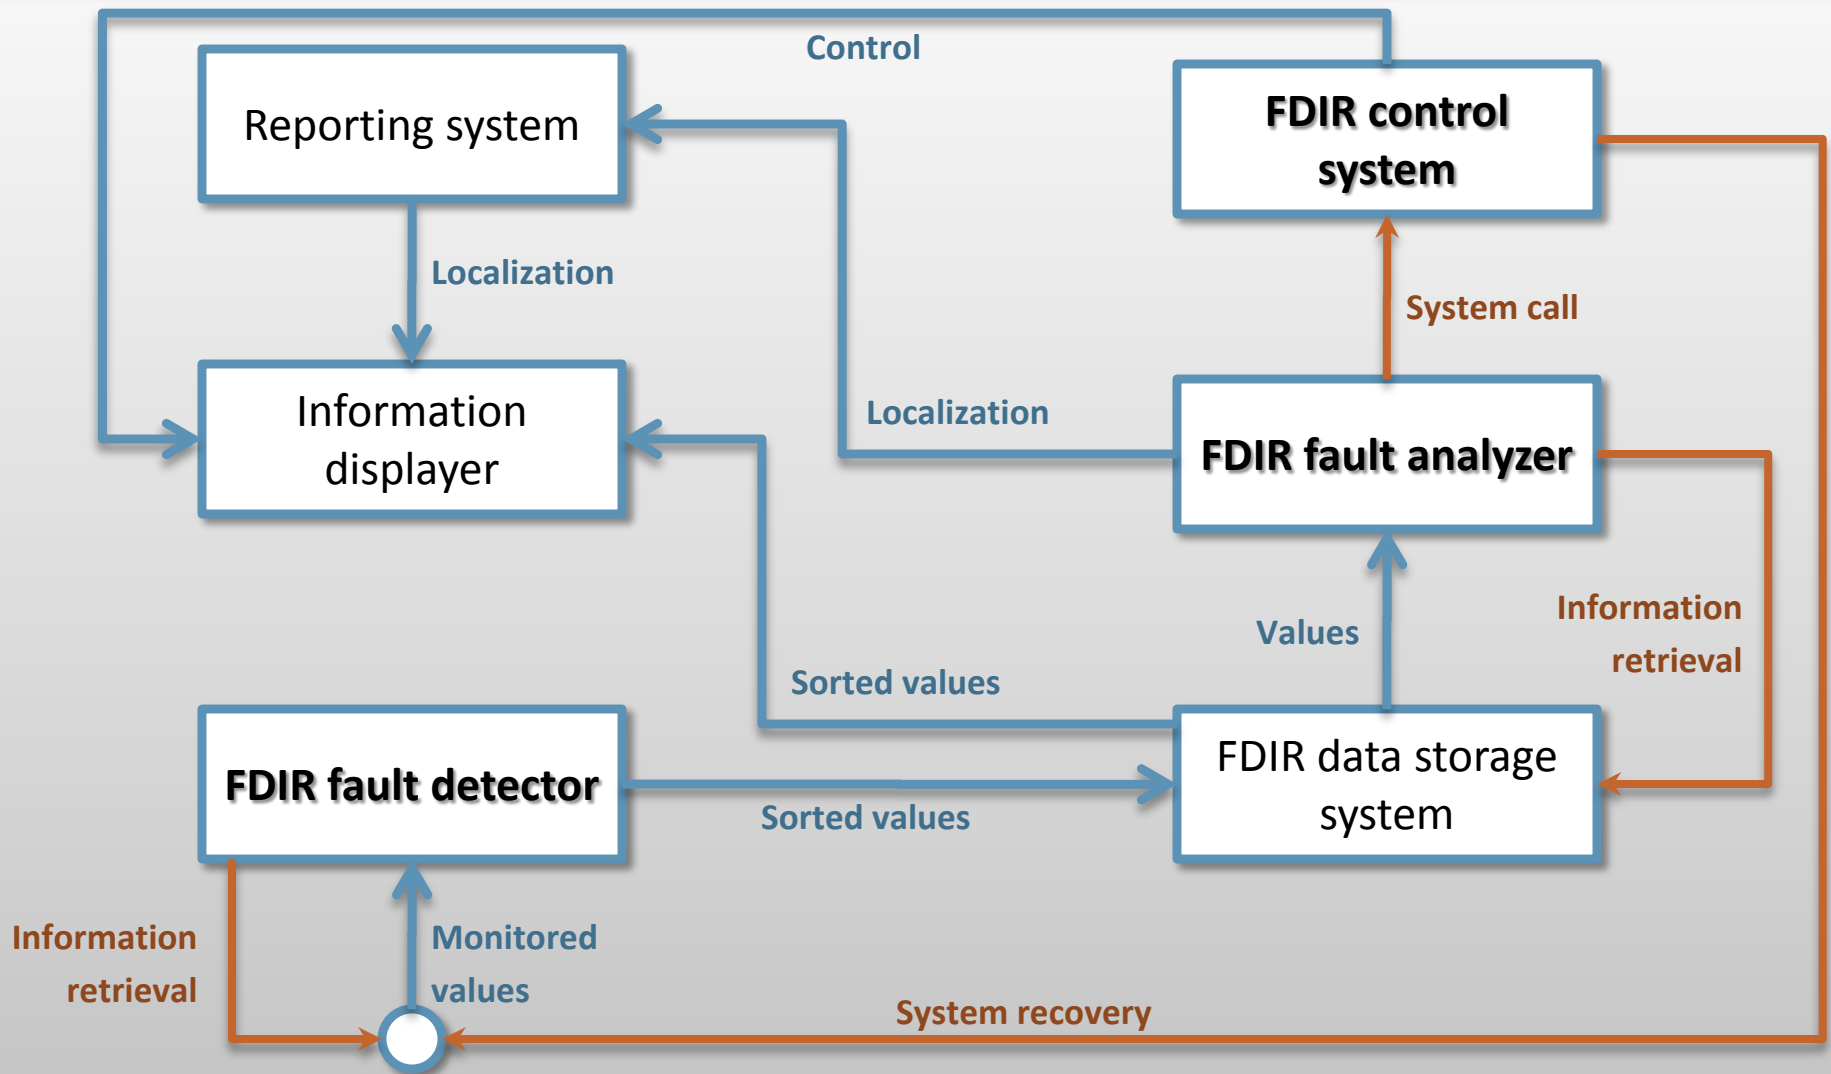

- ❑ **Reliability** : The system must be reliable in all operating conditions.
- ❑ **Availability** : The system must not lock or stall when processing data. It must work asynchronously and must be available all the time.
- ❑ **Adaptability** : FDIR has to be adaptable for manned and unmanned spacecraft.

# 3. ARCHITECTURE SYSTEMS

- ❑ Fault detector
  - ❑ Monitored value checker
  - ❑ Fault filtering system
- ❑ Data storage system (logs, monitored values, reports, etc.)
- ❑ Fault analyzer
  - ❑ Layers system
    - individual device
    - device functions
    - Subsystem
    - system control
    - Manual FDIR
  - ❑ Automatical control
- ❑ Control system
- ❑ Reporting system
- ❑ Information displayer

### 3. OVERALL ARCHITECTURE

**Legend :**

Data flow

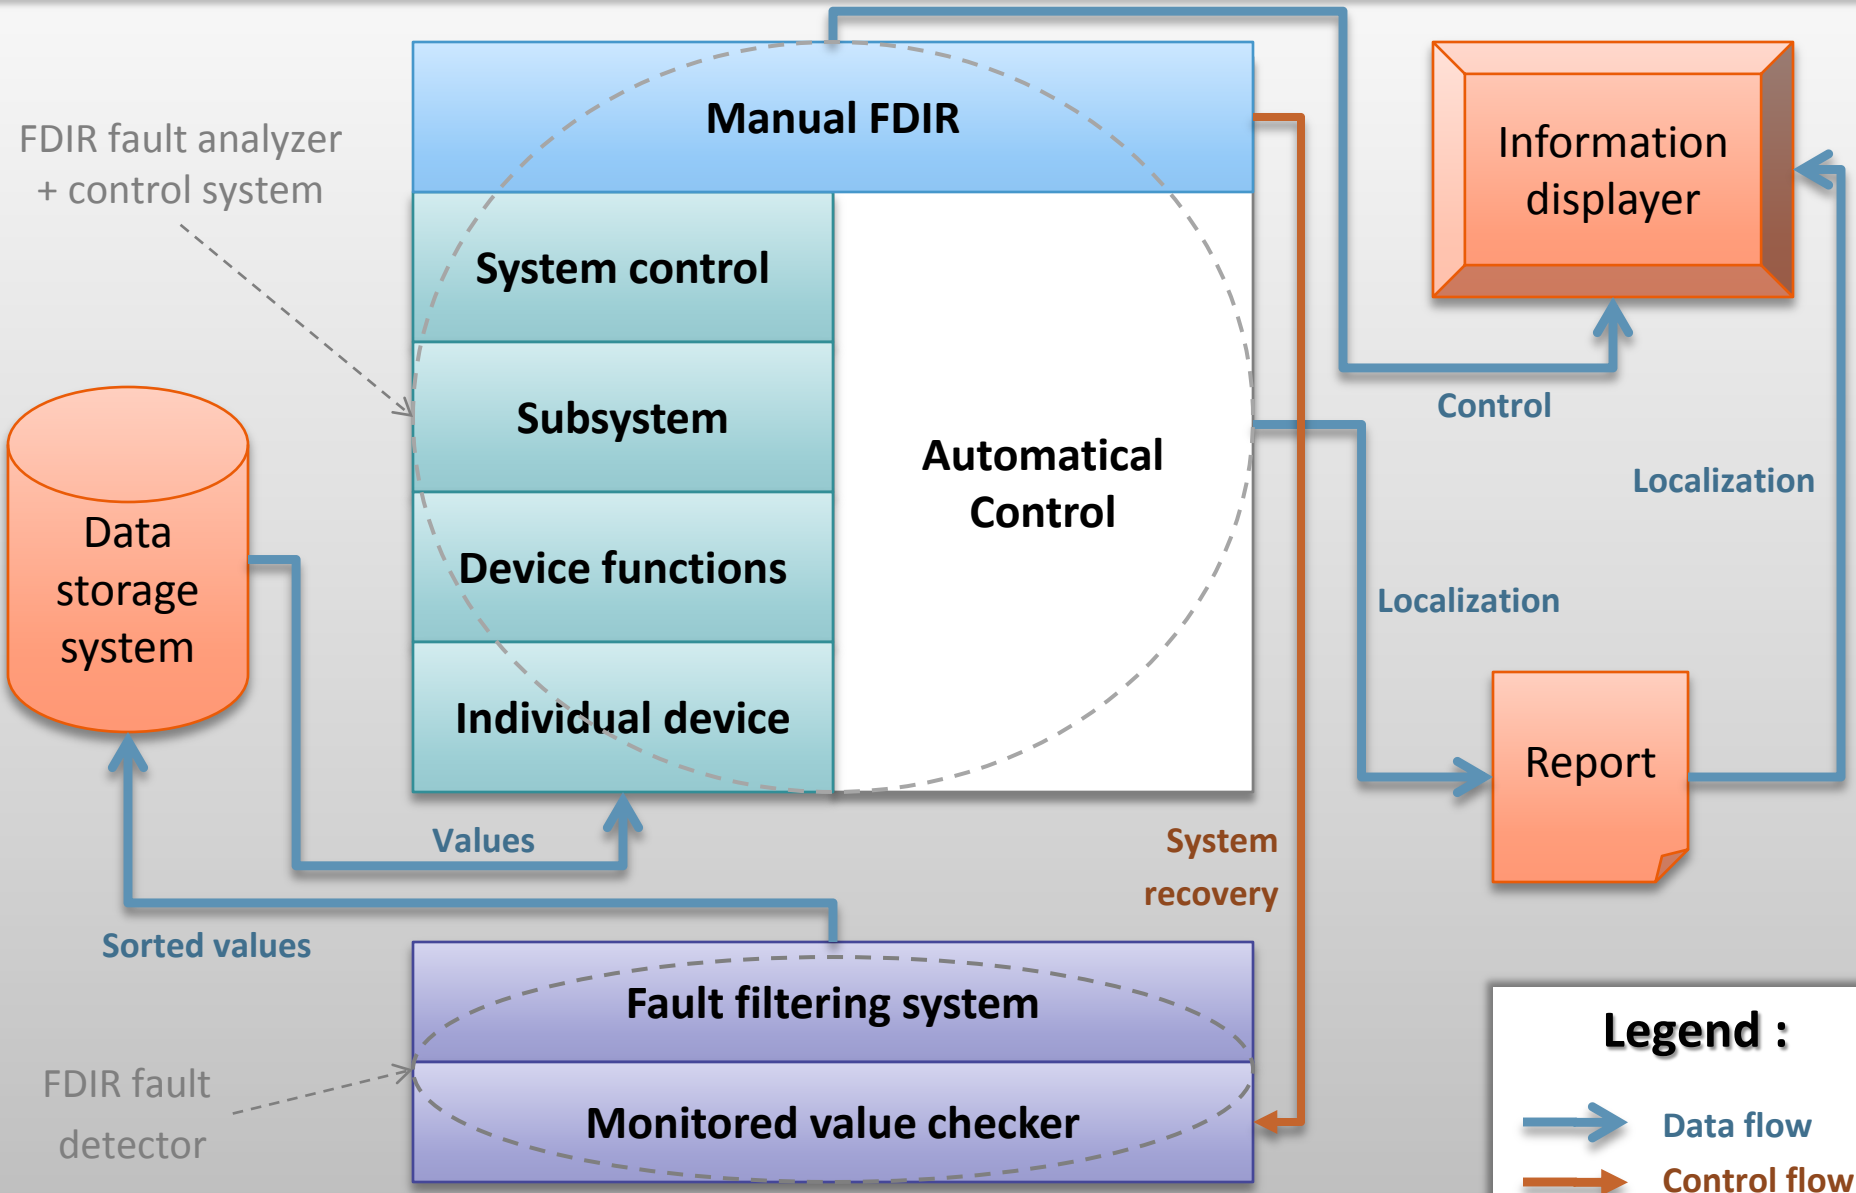

Control flow

FDIR subsystems

Spacecraft system

# 3. OVERALL ARCHITECTURE (CONT.)

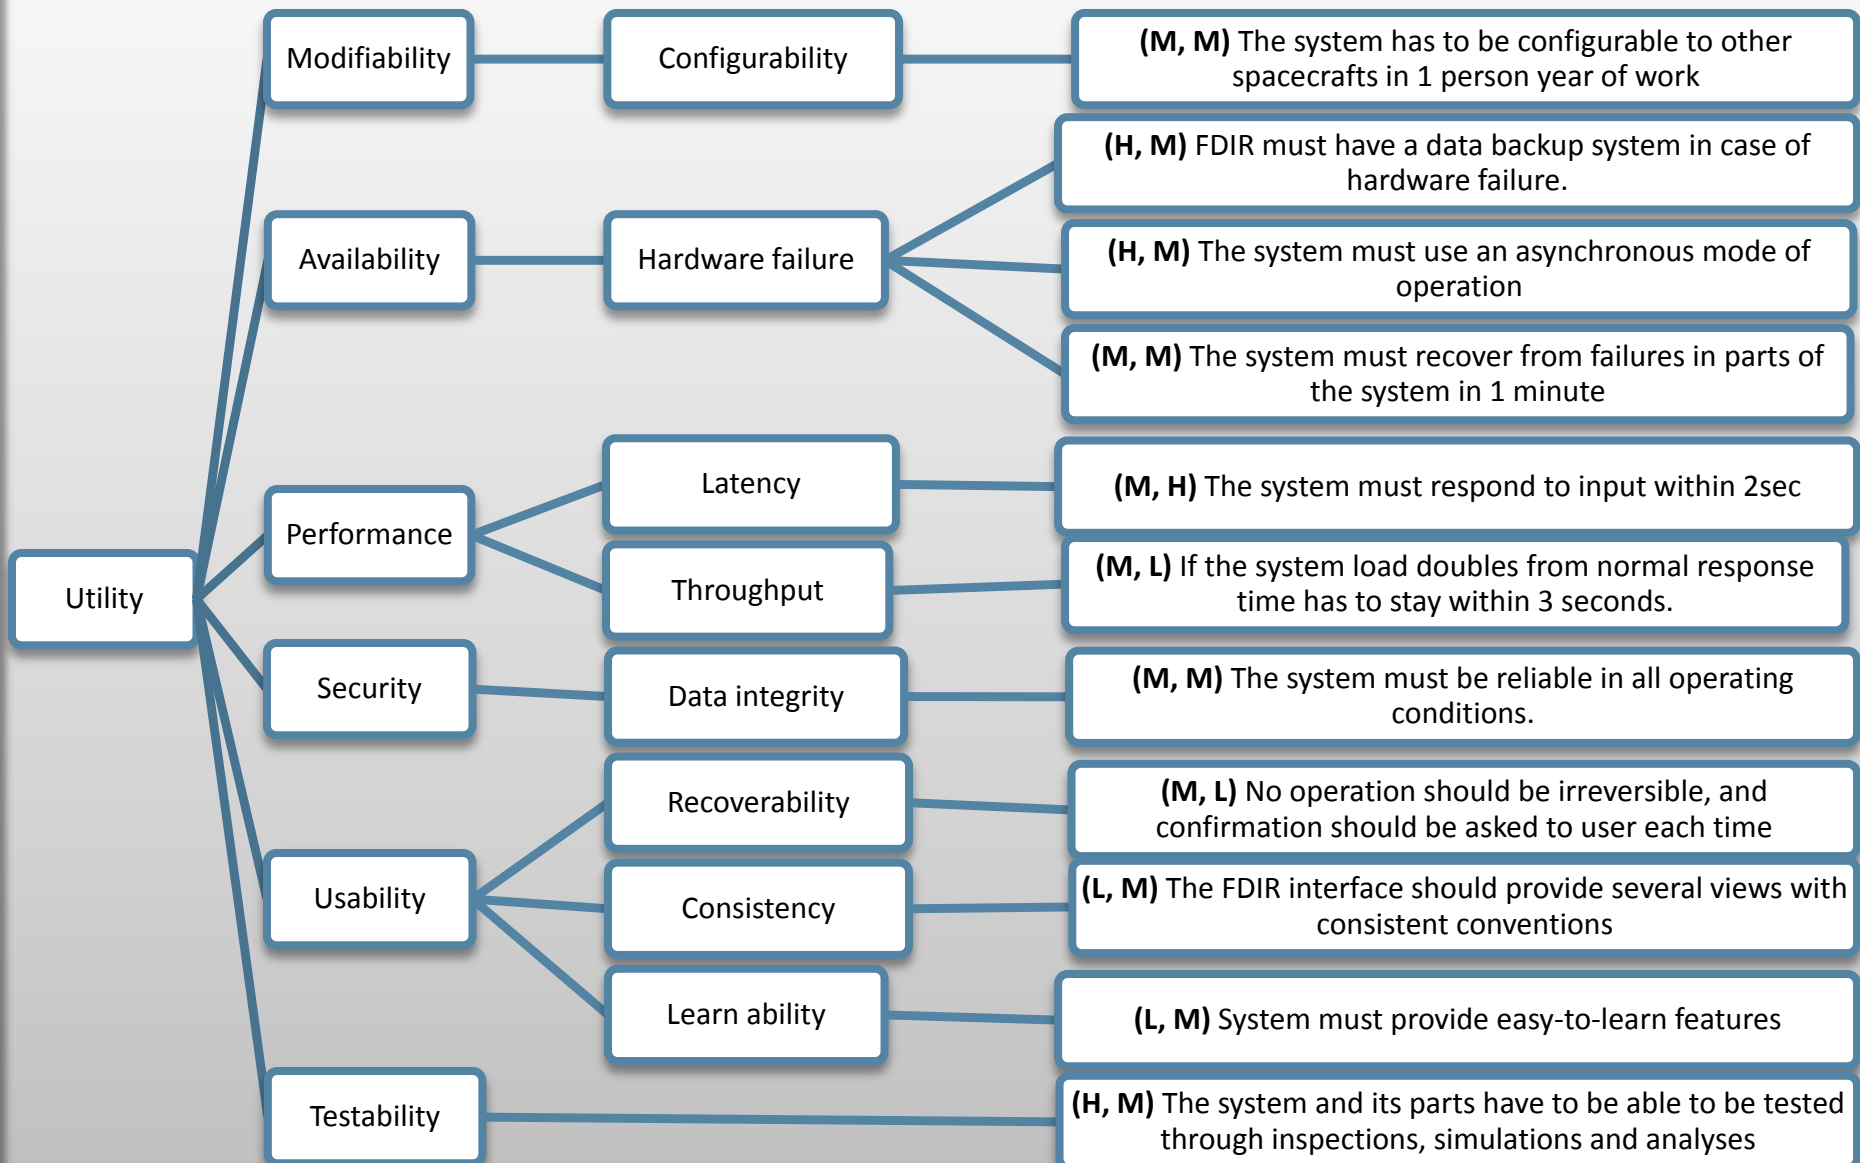

## 4. ARCHITECTURAL APPROACH

### ❑ Event driven architecture

- ❑ Devices subscribe to sub-systems which in turn listen to events broadcasted by the devices.
- ❑ Such events can be for example “announce value” event
- ❑ Choice based on identified quality attributes
  - Enables asynchronous processing
  - High potential for resilience in case of failure
  - Load can be balanced efficiently between systems
- ❑ Architectural approach follows logically from system architecture

# 5. UTILITY TREE

## 5. UTILITY SCENARIOS

### ❑ Use case scenarios

- ❑ No operation should be irreversible, and confirmation should be asked to user each time
- ❑ The FDIR interface should provide several views with consistent conventions

### ❑ Growth scenarios

- ❑ A new sub-system must be able to be installed in to the FDIR in 1 person day of work

### ❑ Exploratory scenarios

- ❑ If the system load doubles from normal response time has to stay within 3 seconds.
- ❑ The system has to be configurable to other spacecrafts in 1 person year of work

*Thank you for attention !*
